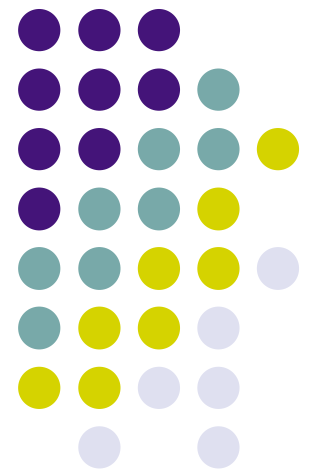
Algebraic Specifications Supplement

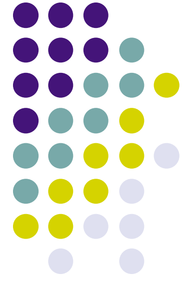
Kenneth M. Anderson

Foundations of Software Engineering

CSCI 5828 — Spring 2008



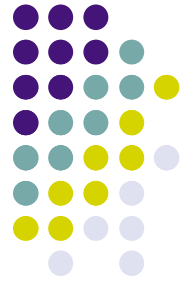
Today’s Lecture



- Examine Algebraic Specifications
  - Compare Stack and Queue specifications
  - Use knowledge gained to look at example in textbook

© Kenneth M. Anderson, 2008

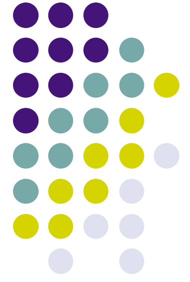
Algebraic Specifications



- Algebras are akin to abstract data types
  - Sets of Values
  - With Three Types of Operators
    - **Generators**: Create new instance of data type
    - **Queries**: Answer questions about the data type
      - Return values are NOT instances of the data type but rather are boolean values or values stored inside the data type
    - **Manipulators**: return values of the data type but are not generators, they are altering an existing instance of the data type in some well defined way

© Kenneth M. Anderson, 2008

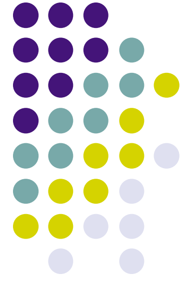
Terminology



- Homogeneous Algebra
  - Single set and its operations
- Heterogeneous Algebra
  - Multiple sets and their operations
- Signature
  - Collection of sets in a heterogeneous algebra
- Sort
  - A set within an algebra

© Kenneth M. Anderson, 2008

Terminology



- Syntax

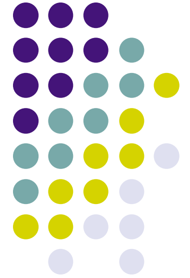
  Signature plus operations with domains and ranges (i.e. functions)

- Semantics

  Equations involving operations; axioms

© Kenneth M. Anderson, 2008

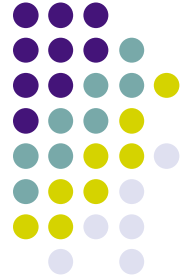
Algebraic Specification of Stack



algebra StackOfItem

© Kenneth M. Anderson, 2008

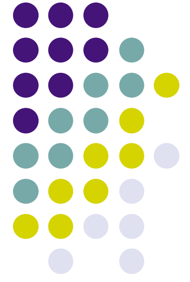
Algebraic Specification of Stack



```
algebra StackOfItem
    imports Boolean;
```

© Kenneth M. Anderson, 2008

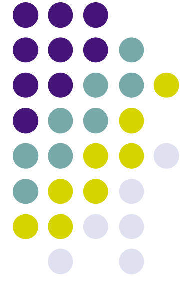
Algebraic Specification of Stack



```
algebra StackOfItem
    imports Boolean;
    introduces
        sorts Stack, Item;
```

© Kenneth M. Anderson, 2008

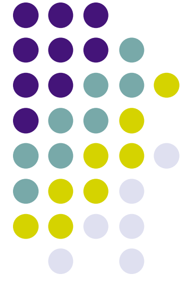
Algebraic Specification of Stack



algebra StackOfItem
imports Boolean;
introduces
sorts Stack, Item;
operations
Create: $\rightarrow$ Stack;
IsEmpty: Stack $\rightarrow$ Boolean;
Push: Stack $\times$ Item $\rightarrow$ Stack;
Pop: Stack $\rightarrow$ Stack;
Top: Stack $\rightarrow$ Item;

© Kenneth M. Anderson, 2008

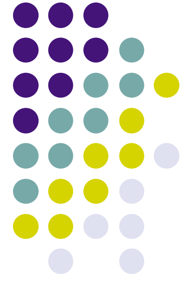
Algebraic Specification of Stack



```
algebra StackOfItem
    imports Boolean;
    introduces
        sorts Stack, Item;
        operations
            Create: → Stack;
            IsEmpty: Stack → Boolean;
            Push: Stack × Item → Stack;
            Pop: Stack → Stack;
            Top: Stack → Item;
    constrains Create, IsEmpty, Push, Pop, Top so that
        Stack generated by [Create, Push]
```

© Kenneth M. Anderson, 2008

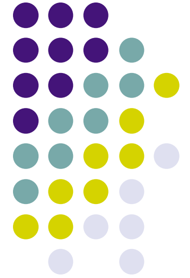
Algebraic Specification of Queue



algebra QueueOfItem

© Kenneth M. Anderson, 2008

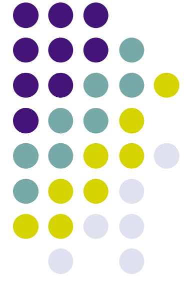
Algebraic Specification of Queue



```
algebra QueueOfItem
   imports Boolean;
```

© Kenneth M. Anderson, 2008

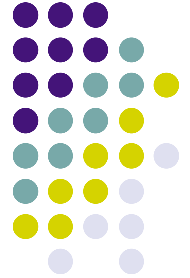
Algebraic Specification of Queue



```
algebra QueueOfItem
    imports Boolean;
    introduces
        sorts Queue, Item;
```

© Kenneth M. Anderson, 2008

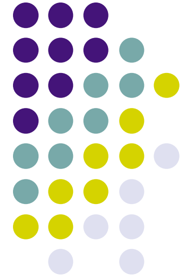
Algebraic Specification of Queue



```
algebra QueueOfItem
    imports Boolean;
    introduces
        sorts Queue, Item;
        operations
            Create: → Queue;
            IsEmpty: Queue → Boolean;
            Enqueue: Queue × Item → Queue;
            Dequeue: Queue → Queue;
            Front: Queue → Item;
```

© Kenneth M. Anderson, 2008

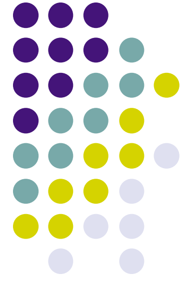
Algebraic Specification of Queue



algebra QueueOfItem
imports Boolean;
introduces
sorts Queue, Item;
operations
Create: $\rightarrow$ Queue;
IsEmpty: Queue $\rightarrow$ Boolean;
Enqueue: Queue $\times$ Item $\rightarrow$ Queue;
Dequeue: Queue $\rightarrow$ Queue;
Front: Queue $\rightarrow$ Item;
constrains Create, IsEmpty, Enqueue, Dequeue, Front so that
Queue generated by [Create, Enqueue]

© Kenneth M. Anderson, 2008

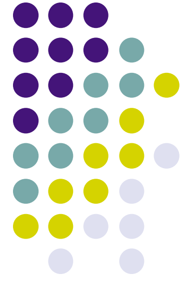
Algebraic Specification of Pizza



algebra Nonsense
imports Boolean;
introduces
sorts Pizza, Car;
operations
Cat: → Pizza;
Horse: Pizza → Boolean;
Dog: Pizza × Car → Pizza;
Bird: Pizza → Pizza;
Mouse: Pizza → Car;
constrains Cat, Horse, Dog, Bird, Mouse so that
Pizza generated by [Cat, Horse]

© Kenneth M. Anderson, 2008

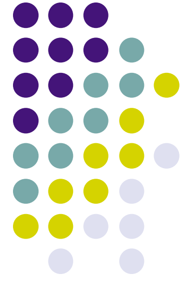
Algebraic Specification of Stack



algebra StackOfItem
imports Boolean;
introduces
sorts Stack, Item;
operations
Create: → Stack;
IsEmpty: Stack → Boolean;
Push: Stack × Item → Stack;
Pop: Stack → Stack;
Top: Stack → Item;
constrains Create, IsEmpty, Push, Pop, Top so that
Stack generated by [Create, Push]

© Kenneth M. Anderson, 2008

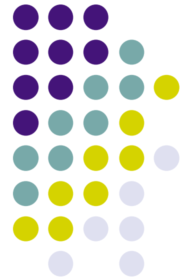
How Generators Work



- The generators of Stack are Create and Push
  - We can think of generators as creating strings that can be "pattern matched" by other operators
- So, the following strings all represent stacks
  - Create
  - Push(**Create**, 1)
  - Push(**Push(Create, 1)**, 2)
  - Push(**Push(Push(Create, 1), 2)**, 3)
- In general, the Push operator has the form
  - Push(Stack, Item) and the result is a new Stack

© Kenneth M. Anderson, 2008

Semantic Specification of Stack

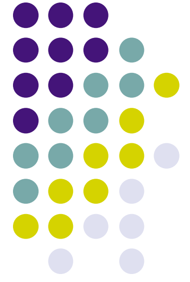


for all [s: Stack; i: Item]

end StackOfItem;

© Kenneth M. Anderson, 2008

Semantic Specification of Stack

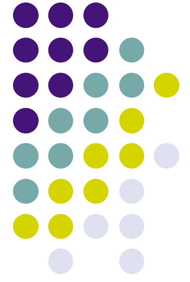


```
for all [s: Stack; i: Item]
    IsEmpty(Create) = true;

end StackOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Stack

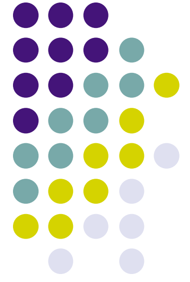


```
for all [s: Stack; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Push(s,i)) = false;

end StackOfItem;
```

These first two rules say: if you pass Create to IsEmpty we return **true**, otherwise we return **false**

Semantic Specification of Stack

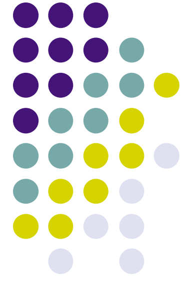


```
for all [s: Stack; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Push(s,i)) = false;
    Pop(Create) = error;

end StackOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Stack



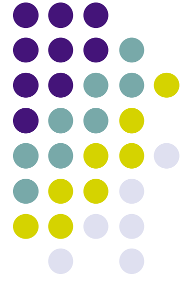
```
for all [s: Stack; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Push(s,i)) = false;
    Pop(Create) = error;
    Top(Create) = error;

end StackOfItem;
```

These next two rules say:
It is an error to pass Create
to the Pop and Top operations

© Kenneth M. Anderson, 2008

Semantic Specification of Stack

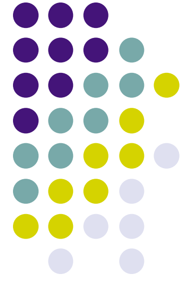


```
for all [s: Stack; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Push(s,i)) = false;
    Pop(Create) = error;
    Top(Create) = error;
    Pop(Push(s,i)) = s;

end StackOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Stack

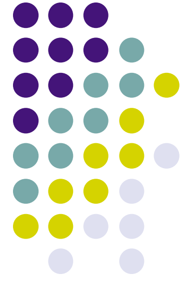


```
    for all [s: Stack; i: Item]
        IsEmpty(Create) = true;
        IsEmpty(Push(s,i)) = false;
        Pop(Create) = error;
        Top(Create) = error;
        Pop(Push(s,i)) = s;
        Top(Push(s,i)) = i;
end StackOfItem;
```

These last two rules say:
If you Pop a stack, you get its internal stack. If you apply Top to a stack, you get its item.

© Kenneth M. Anderson, 2008

How do Pop and Top work?

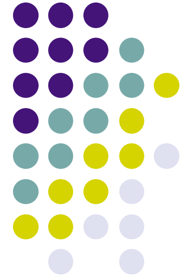


- Pop(Push(**Push(Push(Create, 1), 2)**, 3))
- The rule says
  - Pop(Push(s,i)) = s;
- So, we apply the pattern match and the part in bold above matches “s” and so we return
  - Push(Push(Create, 1), 2)
- And have essentially popped the original stack

- Top(Push(**Push(Push(Create, 1), 2)**, 3))
  - This expression evaluates to “3”

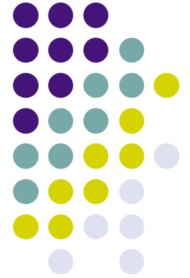
© Kenneth M. Anderson, 2008

Algebraic Specification of Queue



algebra QueueOfItem
  imports Boolean;
  introduces
    sorts Queue, Item;
    operations
      Create: $\rightarrow$ Queue;
      IsEmpty: Queue $\rightarrow$ Boolean;
      Enqueue: Queue $\times$ Item $\rightarrow$ Queue;
      Dequeue: Queue $\rightarrow$ Queue;
      Front: Queue $\rightarrow$ Item;
  constrains Create, IsEmpty, Enqueue, Dequeue, Front so that
    Queue generated by [Create, Enqueue]

Semantic Specification of Queue

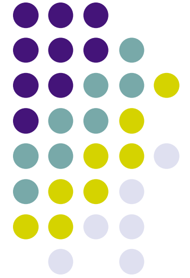


for all [q: Queue; i: Item]

end QueueOfItem;

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

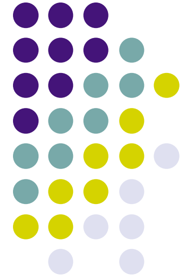


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

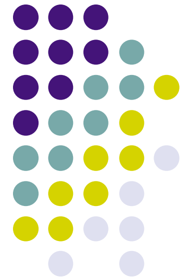


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

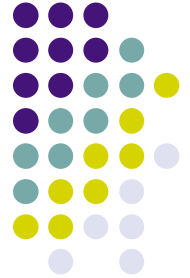


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

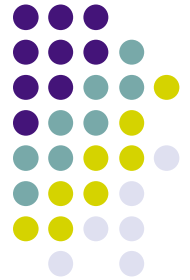


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

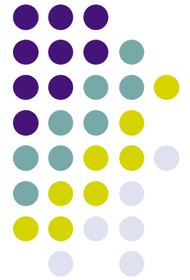


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i))
```

```
end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

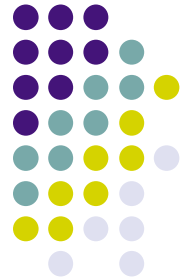


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

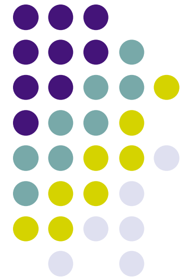


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
                               then Create

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

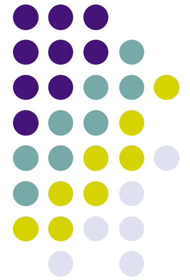


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
                                  then Create
                                  else Enqueue(Dequeue(q),i);

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

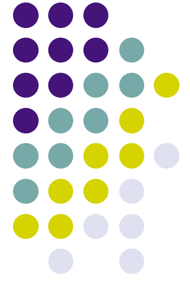
Semantic Specification of Queue



```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
                              then Create
                              else Enqueue(Dequeue(q),i);
    Front(Enqueue(q,i))

end QueueOfItem;
```

Semantic Specification of Queue

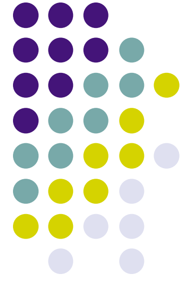


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
                                  then Create
                                  else Enqueue(Dequeue(q),i);
    Front(Enqueue(q,i)) = if (IsEmpty(q))

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

Semantic Specification of Queue

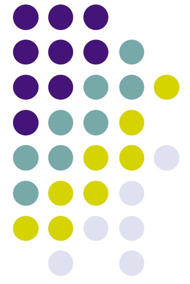


```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
                             then Create
                             else Enqueue(Dequeue(q),i);
    Front(Enqueue(q,i)) = if (IsEmpty(q))
                          then i

end QueueOfItem;
```

© Kenneth M. Anderson, 2008

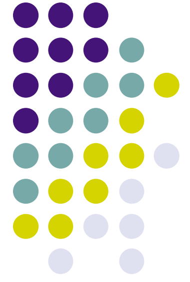
Semantic Specification of Queue



```
for all [q: Queue; i: Item]
    IsEmpty(Create) = true;
    IsEmpty(Enqueue(q,i)) = false;
    Dequeue(Create) = error;
    Front(Create) = error;
    Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
                            then Create
                            else Enqueue(Dequeue(q),i);
    Front(Enqueue(q,i)) = if (IsEmpty(q))
                          then i
                          else Front(q);
end QueueOfItem;
```

© Kenneth M. Anderson, 2008

First: Queue Generators



- Create and Enqueue(q, i) are generators
- The following are valid queues
  - Create
  - Enqueue(**Create**, 1)
  - Enqueue(**Enqueue(Create, 1)**, 2)
  - Enqueue(**Enqueue(Enqueue(Create, 1), 2)**, 3)
- IsEmpty operator is easy to understand
  - Create is Empty, anything else is not

© Kenneth M. Anderson, 2008

Second: What about Front?

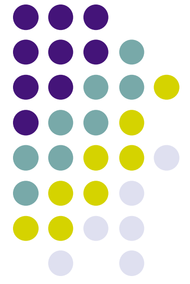
- Rule: Front(Enqueue(q,i)) = if (IsEmpty(q))
  then i
  else Front(q);
  - Front(Enqueue(**Enqueue(Create, 1)**, 2))
  - q is highlighted in bold; its not empty, so
  - Front(Enqueue(**Create**, 1))
  - q is again highlighted in bold; it IS empty, so
  - 1
- And that indeed is the front of the original queue

Third: What about Dequeue?

- Rule: Dequeue(Enqueue(q,i)) = if (IsEmpty(q))
  then Create
  else Enqueue(Dequeue(q),i)
  - Dequeue(Enqueue(**Enqueue(Create, 1)**, 2))
  - Enqueue(**Dequeue(Enqueue(Create, 1))**, 2)
  - Enqueue(Create, 2)
- We are left with a queue in which the first element was indeed removed

© Kenneth M. Anderson, 2008

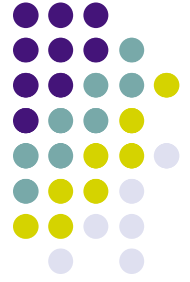
Textbook Example: Library



- Important to realize that example in book is **incomplete**
- Operators are:
  - New, buy, lose, borrow, return, reserve, unreserve, recall, isInCatalogue, isOnLoan, isOnReserve
- Generators: New, buy, borrow, reserve
- Queries: isInCatalogue, isOnLoan, isOnReserve
- Manipulators: lose, return, unreserve, recall

© Kenneth M. Anderson, 2008

Example Libraries

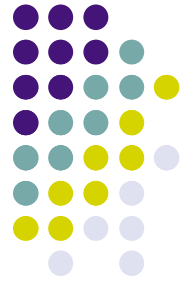


- New
- buy(**New**, a)
- buy(**buy(New, a)**, b)
- borrow(**buy(buy(New, a), b)**, b)
- reserve(**borrow(buy(buy(New, a), b), b)**, a)

- Last library has two books “a” and “b”
  - a is on reserve, b has been borrowed

© Kenneth M. Anderson, 2008

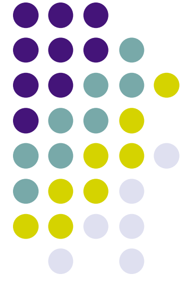
Example: IsInCatalogue (I)



- Rules
  - isInCatalogue(New, i) ≡ ERROR
  - isInCatalogue(buy(lib, i), i2) ≡
    - if i = i2 then true else isInCatalogue(lib, i2)
  - isInCatalogue(borrow(lib, i), i2) ≡
    - isInCatalogue(lib, i2)
  - isInCatalogue(reserve(lib, i), i2) ≡
    - isInCatalogue(lib, i2)
- We must supply definitions for each non-generator being applied to instances of each generator

© Kenneth M. Anderson, 2008

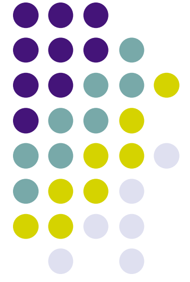
Example: IsInCatalogue (II)



- IsInCatalogue(borrow(**buy(buy(New, a), b),** b), a)
- IsInCatalogue(buy(**buy(New, a)**, b), a)
- IsInCatalogue(buy(**New**, a), a)
- True
- IsInCatalogue(borrow(**buy(buy(New, a), b),** b), c)
- IsInCatalogue(buy(**buy(New, a)**, b), c)
- IsInCatalogue(buy(**New**, a), c)
- IsInCatalogue(New, c)
- False

© Kenneth M. Anderson, 2008

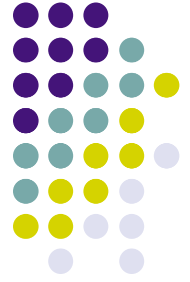
Example: Lose (I)



- Rules
  - lose(New, i) ≡ ERROR
  - lose(buy(lib, i), i2) ≡
    - if i = i2 then lib else buy(lose(lib, i2), i)
  - lose(borrow(lib, i), i2) ≡
    - if i = i2 then lose(lib, i2) else borrow(lose(lib, i2), i)
  - lose(reserve(lib, i), i2) ≡
    - if i = i2 then lose(lib, i2) else reserve(lose(lib, i2), i)

© Kenneth M. Anderson, 2008

Example: Lose (II)

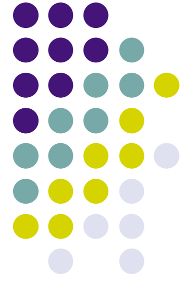


- lose(reserve(**borrow(buy(buy(New, a), b), b)**, a), a)
- lose(borrow(**buy(buy(New, a), b)**, b), a)
- borrow(lose(buy(**buy(New, a)**, b), a), b)
- borrow(buy(lose(buy(**New**, a), a), b), b)
- borrow(buy(New, b), b)

- In moving to the last step, the entire phrase
  - lose(buy(New, a), a)
- was simply replaced with
  - New

© Kenneth M. Anderson, 2008

Summary



- Algebraic specifications model the behavior of a system via operations on structured strings that capture the system's state
  - Other notations can "tempt" developers into specifying the implementation of a system early
  - That is, other notations tend to suggest particular implementations
    - UML class model ⇒ Classes in OO language
    - Data Flow Diagrams ⇒ Data Processing Modules
    - Z specification ⇒ sets, sequences, and functions
- Algebraic specs can reduce this temptation since their suggested implementation is so inefficient!
