Chapter 2

Processes & Threads
We structure complex systems as sets of simpler activities, each represented as a sequential process. Processes can overlap or be concurrent, so as to reflect the concurrency inherent in the physical world, or to offload time-consuming tasks, or to manage communications or other devices.

Designing concurrent software can be complex and error prone. A rigorous engineering approach is essential.
processes and threads

**Concepts:** processes - units of sequential execution.

**Models:** finite state processes (FSP) to model processes as sequences of actions. labelled transition systems (LTS) to analyse, display and animate behavior.

**Practice:** Java threads
2.1 Modeling Processes

Models are described using state machines, known as Labelled Transition Systems \textit{LTS}. These are described textually as finite state processes (\textit{FSP}) and displayed and analysed by the \textit{LTSA} analysis tool.

\begin{itemize}
  \item \textbf{LTS} - graphical form
  \item \textbf{FSP} - algebraic form
\end{itemize}
A process is the execution of a sequential program. It is modeled as a finite state machine which transits from state to state by executing a sequence of atomic actions.

Can finite state models produce infinite traces?
If $x$ is an action and $P$ a process then $(x\rightarrow P)$ describes a process that initially engages in the action $x$ and then behaves exactly as described by $P$.

**ONESHOT** = $(\text{once} \rightarrow \text{STOP})$. **ONESHOT state machine**

(terminating process)

Convention: actions begin with lowercase letters

PROCESSES begin with uppercase letters
Repetitive behaviour uses recursion:

\[
\text{SWITCH} = \text{OFF}, \\
\text{OFF} = (\text{on} \rightarrow \text{ON}), \\
\text{ON} = (\text{off} \rightarrow \text{OFF}).
\]

Substituting to get a more succinct definition:

\[
\text{SWITCH} = \text{OFF}, \\
\text{OFF} = (\text{on} \rightarrow (\text{off} \rightarrow \text{OFF})).
\]

And again:

\[
\text{SWITCH} = (\text{on} \rightarrow \text{off} \rightarrow \text{SWITCH}).
\]
animation using LTSA

The LTSA animator can be used to produce a trace.

Ticked actions are eligible for selection.

In the LTS, the last action is highlighted in red.
FSP - action prefix

FSP model of a traffic light:

\[ \text{TRAFFICLIGHT} = (\text{red} \rightarrow \text{orange} \rightarrow \text{green} \rightarrow \text{orange} \rightarrow \text{TRAFFICLIGHT}). \]

LTS generated using \( LTSA \):

![Diagram of a traffic light LTS]

Trace:

\[ \text{red} \rightarrow \text{orange} \rightarrow \text{green} \rightarrow \text{orange} \rightarrow \text{red} \rightarrow \text{orange} \rightarrow \text{green} \ldots \]
If \( x \) and \( y \) are actions then \((x \rightarrow P \mid y \rightarrow Q)\) describes a process which initially engages in either of the actions \( x \) or \( y \). After the first action has occurred, the subsequent behavior is described by \( P \) if the first action was \( x \) and \( Q \) if the first action was \( y \).

Who or what makes the choice?

Is there a difference between input and output actions?
FSP - choice

FSP model of a drinks machine:

\[
\text{DRINKS} = (\text{red} \rightarrow \text{coffee} \rightarrow \text{DRINKS} \\
| \text{blue} \rightarrow \text{tea} \rightarrow \text{DRINKS})
\]

LTS generated using \textit{LTS}: 

Possible traces?
Non-deterministic choice

Process \((x \rightarrow P \mid x \rightarrow Q)\) describes a process which engages in \(x\) and then behaves as either \(P\) or \(Q\).

\[
\text{COIN} = (\text{toss} \rightarrow \text{HEADS} \mid \text{toss} \rightarrow \text{TAILS}), \quad \\
\text{HEADS} = (\text{heads} \rightarrow \text{COIN}), \quad \\
\text{TAILS} = (\text{tails} \rightarrow \text{COIN}).
\]

Tossing a coin.

Possible traces?
Modeling failure

How do we model an unreliable communication channel which accepts \texttt{in} actions and if a failure occurs produces no output, otherwise performs an \texttt{out} action?

Use non-determinism...

\[
\text{CHAN} = (\text{in} \rightarrow \text{CHAN} \mid \text{in} \rightarrow \text{out} \rightarrow \text{CHAN})
\]
FSP - indexed processes and actions

Single slot buffer that inputs a value in the range 0 to 3 and then outputs that value:

\[ \text{BUFF} = (\text{in}[i:0..3] \rightarrow \text{out}[i] \rightarrow \text{BUFF}) \]

equivalent to

\[ \text{BUFF} = (\text{in}[0] \rightarrow \text{out}[0] \rightarrow \text{BUFF} | \text{in}[1] \rightarrow \text{out}[1] \rightarrow \text{BUFF} | \text{in}[2] \rightarrow \text{out}[2] \rightarrow \text{BUFF} | \text{in}[3] \rightarrow \text{out}[3] \rightarrow \text{BUFF}) \]

or using a process parameter with default value:

\[ \text{BUFF}(N=3) = (\text{in}[i:0..N] \rightarrow \text{out}[i] \rightarrow \text{BUFF}) \]

indexed actions generate labels of the form `action.index`
FSP - indexed processes and actions

Local indexed process definitions are equivalent to process definitions for each index value

index expressions to model calculation:

\[
\begin{align*}
\text{const } N &= 1 \\
\text{range } T &= 0..N \\
\text{range } R &= 0..2*N \\
\text{SUM} &= (\text{in}[a:T][b:T]->\text{TOTAL}[a+b]) , \\
\text{TOTAL}[s:R] &= (\text{out}[s]->\text{SUM}).
\end{align*}
\]
The choice \((\text{when } B \ x \rightarrow P \ | \ y \rightarrow Q)\) means that when the guard \(B\) is true then the actions \(x\) and \(y\) are both eligible to be chosen, otherwise if \(B\) is false then the action \(x\) cannot be chosen.

\[
\begin{align*}
\text{COUNT (N=3) } &= \text{COUNT}[0], \\
\text{COUNT}[i:0..N] &= (\text{when}(i<N) \ \text{inc} \rightarrow \text{COUNT}[i+1] \\
&\quad \text{when}(i>0) \ \text{dec} \rightarrow \text{COUNT}[i-1])
\end{align*}
\]
FSP - guarded actions

A countdown timer which beeps after N ticks, or can be stopped.

\[
\text{COUNTDOWN (N=3) } = (\text{start} \rightarrow \text{COUNTDOWN}[N]), \\
\text{COUNTDOWN}[i:0..N] = \\
(\text{when}(i>0) \text{ tick} \rightarrow \text{COUNTDOWN}[i-1] \\
| \text{when}(i==0) \text{ beep} \rightarrow \text{STOP} \\
| \text{stop} \rightarrow \text{STOP}) .
\]

Concurrency: processes & threads
FSP - guarded actions

What is the following FSP process equivalent to?

```
const False = 0
P = (when (False) doanything->P).
```

**Answer:**

STOP
The alphabet of a process is the set of actions in which it can engage.

Process alphabets are implicitly defined by the actions in the process definition.

The alphabet of a process can be displayed using the LTSA alphabet window.

Process: COUNTDOWN
Alphabet:
{ beep, start, stop, tick }
Alphabet extension can be used to extend the implicit alphabet of a process:

\[
\text{WRITER} = (\text{write}[1] \rightarrow \text{write}[3] \rightarrow \text{WRITER}) + \{\text{write}[0..3]\}.
\]

Alphabet of \text{WRITER} is the set \{\text{write}[0..3]\}

(we make use of alphabet extensions in later chapters)
Revision & Wake-up Exercise

In FSP, model a process **FILTER**, that exhibits the following repetitive behavior:

Inputs a value \( v \) between 0 and 5, but only outputs it if \( v \leq 2 \), otherwise it discards it.

\[
\text{FILTER} = (\text{in}[v:0..5] \rightarrow \text{DECIDE}[v]), \\
\text{DECIDE}[v:0..5] = (\ ? \ ) .
\]
2.2 Implementing processes

Modeling processes as finite state machines using FSP/LTS.

Implementing threads in Java.

**Note:** to avoid confusion, we use the term *process* when referring to the models, and *thread* when referring to the implementation in Java.
Implementing processes - the OS view

A (heavyweight) process in an operating system is represented by its code, data and the state of the machine registers, given in a descriptor. In order to support multiple (lightweight) threads of control, it has multiple stacks, one for each thread.
threads in Java

A Thread class manages a single sequential thread of control. Threads may be created and deleted dynamically.

The Thread class executes instructions from its method run(). The actual code executed depends on the implementation provided for run() in a derived class.

```java
class MyThread extends Thread {
    public void run() {
        //......
    }
}
```

Creating a thread object:

```java
Thread a = new MyThread();
```
Since Java does not permit multiple inheritance, we often implement the `run()` method in a class not derived from Thread but from the interface Runnable.

```java
public interface Runnable {
    public abstract void run();
}

class MyRun implements Runnable {
    public void run() {
        //....
    }
}

Creating a thread object:
```Thread b = new Thread(new MyRun());```
thread life-cycle in Java

An overview of the life-cycle of a thread as state transitions:

- **Created**
  - `new Thread()`
  - `start()` causes the thread to call its `run()` method.

- **Alive**
  - `start()`
  - `stop()`, or `run()` returns

- **Terminated**
  - `stop()`

The predicate `isAlive()` can be used to test if a thread has been started but not terminated. Once terminated, it cannot be restarted (cf. mortals).
thread alive states in Java

Once started, an alive thread has a number of substates:

Also, \texttt{wait()} makes a Thread Non-Runnable, and \texttt{notify()} makes it Runnable (used in later chapters).

©Magee/Kramer 2nd Edition
Java thread lifecycle - an FSP specification

\[
\begin{align*}
\text{THREAD} &= \text{CREATED}, \\
\text{CREATED} &= (\text{start} \to \text{RUNNABLE} \\
&\quad \mid \text{stop} \to \text{TERMINATED}), \\
\text{RUNNING} &= (\{\text{suspend, sleep}\} \to \text{NON\_RUNNABLE} \\
&\quad \mid \text{yield} \to \text{RUNNABLE} \\
&\quad \mid \{\text{stop, end}\} \to \text{TERMINATED} \\
&\quad \mid \text{run} \to \text{RUNNING}), \\
\text{RUNNABLE} &= (\text{suspend} \to \text{NON\_RUNNABLE} \\
&\quad \mid \text{dispatch} \to \text{RUNNING} \\
&\quad \mid \text{stop} \to \text{TERMINATED}), \\
\text{NON\_RUNNABLE} &= (\text{resume} \to \text{RUNNABLE} \\
&\quad \mid \text{stop} \to \text{TERMINATED}), \\
\text{TERMINATED} &= \text{STOP}.
\end{align*}
\]
Java thread lifecycle - an FSP specification

end, run, dispatch are not methods of class Thread.

States 0 to 4 correspond to CREATED, TERMINATED, RUNNABLE, RUNNING, and NON-RUNNABLE respectively.
CountDown timer example

COUNTDOWN (N=3) = (start->COUNTDOWN[N]),
COUNTDOWN[i:0..N] =
  (when(i>0) tick->COUNTDOWN[i-1]
  |when(i==0)beep->STOP
  |stop->STOP
).

Implementation in Java?
CountDown timer - class diagram

The class **CountDown** derives from **Applet** and contains the implementation of the **run()** method which is required by **Thread**.

The class **NumberCanvas** provides the display canvas.

Concurrency: processes & threads
CountDown class

```java
public class CountDown extends Applet
    implements Runnable {
    Thread counter; int i;
    final static int N = 10;
    AudioClip beepSound, tickSound;
    NumberCanvas display;

    public void init() {...}
    public void start() {...}
    public void stop() {...}
    public void run() {...}
    private void tick() {...}
    private void beep() {...}
}
```
CountDown class - start(), stop() and run()

```java
public void start() {
    counter = new Thread(this);
    i = N; counter.start();
}

public void stop() {
    counter = null;
}

public void run() {
    while(true) {
        if (counter == null) return;
        if (i>0)  { tick(); --i; }
        if (i==0) { beep(); return;}
    }
}
```

**COUNTDOWN Model**

- **start** -> CD[3]
- **run** -> CD[i:0..3] = (while (i>0) tick -> CD[i-1] |when (i==0) beep -> STOP).
- **STOP** -> [predefined in FSP to end a process]

**CD[i] process**

- recursion transformed into while loop
- **STOP** when run() returns
**CountDown execution**

- start()
- new Thread(this)
- counter.start()
- target.run()
- tick()
- beep()

**CountDown**
CountDown execution

CountDown

- start()
- new Thread(this)
- counter.start()
- target.run()
- tick()
- tick()
- counter=null

- stop()
- init()

- created
- alive
- terminated
Summary

◆ Concepts

○ process - unit of concurrency, execution of a program

◆ Models

○ LTS to model processes as state machines - sequences of atomic actions

○ FSP to specify processes using prefix “->”, choice “|” and recursion.

◆ Practice

○ Java threads to implement processes.

○ Thread lifecycle - created, running, runnable, non-runnable, terminated.
