

Speech and Language Processing

SLP Chapter 13 Parsing

Today

- Parsing with CFGs
 - Bottom-up, top-down
 - Ambiguity
 - CKY parsing

Parsing

- Parsing with CFGs refers to the task of assigning proper trees to input strings
- Proper here means a tree that covers **all and only the elements of the input** and **has an S at the top**
- It doesn't actually mean that the system can select the correct tree from among all the possible trees

9/2/08

Speech and Language Processing - Jurafsky and Martin

3

Parsing

- As with everything of interest, parsing involves a **search** which involves the making of choices
- We'll start with some basic (meaning bad) methods before moving on to the one or two that you need to know

9/2/08

Speech and Language Processing - Jurafsky and Martin

4

For Now

- **Assume...**
 - You have all the words already in some buffer
 - The input isn't POS tagged
 - We won't worry about morphological analysis
 - All the words are known
- These are all problematic in various ways, and would have to be addressed in real applications.

9/2/08

Speech and Language Processing - Jurafsky and Martin

5

Top-Down Search

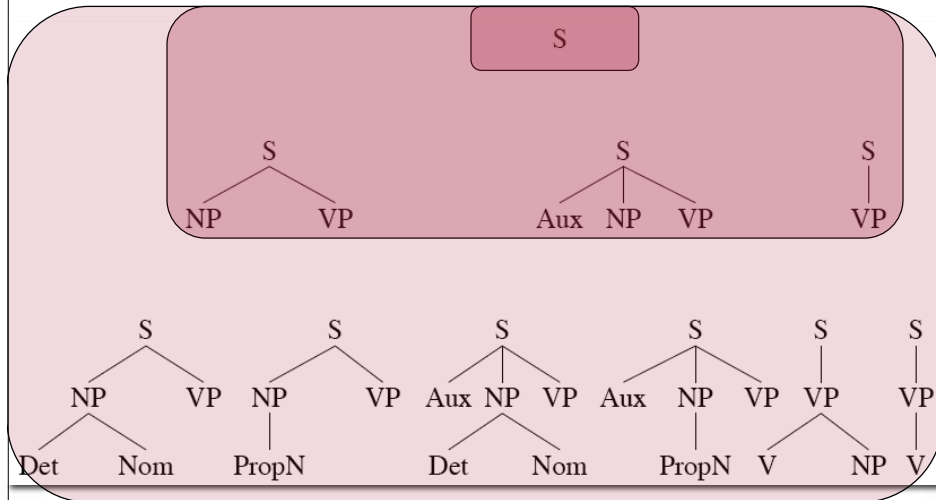

- Since we're trying to find trees rooted with an *S* (Sentences), why not start with the rules that give us an *S*.
- Then we can work our way down from there to the words.

9/2/08

Speech and Language Processing - Jurafsky and Martin

6

Top Down Space

9/2/08

Speech and Language Processing - Jurafsky and Martin

7

Bottom-Up Parsing

- Of course, we also want trees that cover the input words. So we might also start with trees that link up with the words in the right way.
- Then work your way up from there to larger and larger trees.

9/2/08

Speech and Language Processing - Jurafsky and Martin

8

Bottom-Up Search

Book that flight

9/2/08

Speech and Language Processing - Jurafsky and Martin

9

Bottom-Up Search

Book that flight

9/2/08

Speech and Language Processing - Jurafsky and Martin

10

Bottom-Up Search

9/2/08

Speech and Language Processing - Jurafsky and Martin

11

Bottom-Up Search

9/2/08

Speech and Language Processing - Jurafsky and Martin

12

Bottom-Up Search

9/2/08

Speech and Language Processing - Jurafsky and Martin

13

Top-Down and Bottom-Up

- **Top-down**
 - Only searches for trees that can be answers (i.e. S's)
 - But also suggests trees that are not consistent with any of the words
- **Bottom-up**
 - Only forms trees consistent with the words
 - But suggests trees that make no sense globally

9/2/08

Speech and Language Processing - Jurafsky and Martin

14

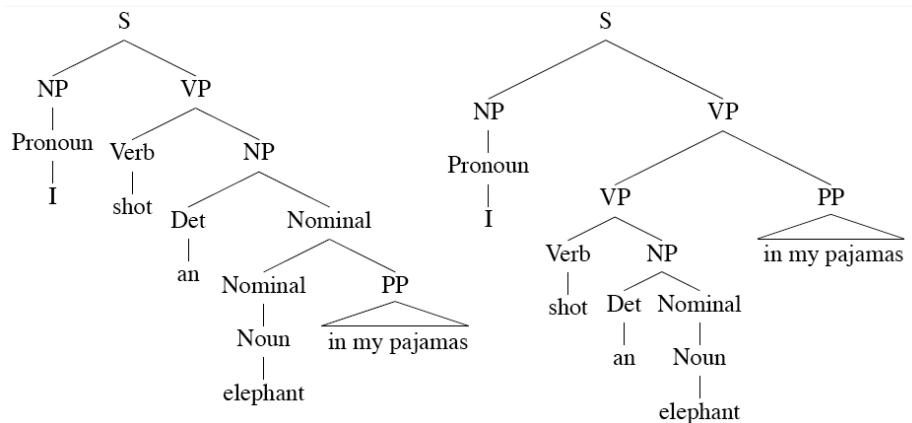

Control

- Of course, in both cases we left out how to keep track of the search space and how to make choices
 - Which node to try to expand next
 - Which grammar rule to use to expand a node
- One approach is called backtracking.
 - Make a choice, if it works out then fine
 - If not then back up and make a different choice

Problems

- Even with the best filtering, backtracking methods are doomed because of two inter-related problems
 - Ambiguity
 - Shared subproblems

Ambiguity

9/2/08

Speech and Language Processing - Jurafsky and Martin

17

Shared Sub-Problems

- No matter what kind of search (top-down or bottom-up or mixed) that we choose.
 - We don't want to redo work we've already done.
 - Unfortunately, naïve backtracking will lead to duplicated work.

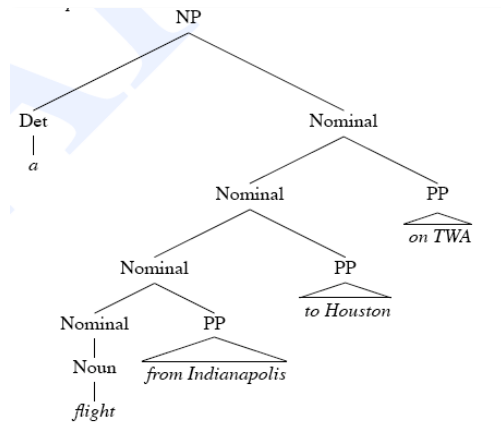

9/2/08

Speech and Language Processing - Jurafsky and Martin

18

Shared Sub-Problems

- Consider
 - A flight from Indianapolis to Houston on TWA

9/2/08

Speech and Language Processing - Jurafsky and Martin

19

Shared Sub-Problems

- Assume a top-down parse making choices among the various Nominal rules.
- In particular, between these two
 - Nominal -> Noun
 - Nominal -> Nominal PP
- Statically choosing the rules in this order leads to the following bad results...

9/2/08

Speech and Language Processing - Jurafsky and Martin

20

Shared Sub-Problems

9/2/08

Speech and Language Processing - Jurafsky and Martin

21

Shared Sub-Problems

9/2/08

Speech and Language Processing - Jurafsky and Martin

22

Shared Sub-Problems

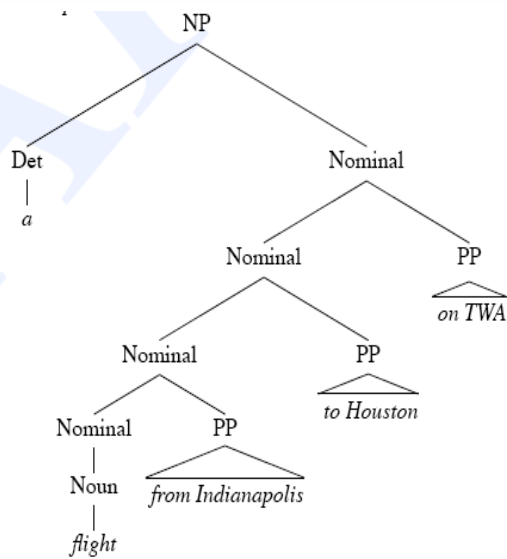

9/2/08

Speech and Language Processing - Jurafsky and Martin

23

Shared Sub-Problems

9/2/08

Speech and Language Processing - Jurafsky and Martin

24

Dynamic Programming

- DP search methods fill tables with partial results and thereby
 - Avoid doing avoidable repeated work
 - Solve exponential problems in polynomial time (well, no not really)
 - Efficiently store ambiguous structures with shared sub-parts.
- We'll cover two approaches that roughly correspond to top-down and bottom-up approaches.
 - CKY
 - Earley

9/2/08

Speech and Language Processing - Jurafsky and Martin

25

CKY Parsing

- First we'll limit our grammar to epsilon-free, binary rules (more later)
- Consider the rule $A \rightarrow BC$
 - If there is an A somewhere in the input then there must be a B followed by a C in the input.
 - If the A spans from i to j in the input then there must be some k st. $i < k < j$
 - Ie. The B splits from the C someplace.

9/2/08

Speech and Language Processing - Jurafsky and Martin

26

Problem

- What if your grammar isn't binary?
 - As in the case of the TreeBank grammar?
- Convert it to binary... any arbitrary CFG can be rewritten into Chomsky-Normal Form automatically.
- What does this mean?
 - The resulting grammar accepts (and rejects) the same set of strings as the original grammar.
 - **But** the resulting derivations (trees) are different.

9/2/08

Speech and Language Processing - Jurafsky and Martin

27

Problem

- More specifically, we want our rules to be of the form

$A \rightarrow BC$

Or

$A \rightarrow w$

That is, rules can expand to either 2 non-terminals or to a single terminal.

9/2/08

Speech and Language Processing - Jurafsky and Martin

28

Binarization Intuition

- Eliminate chains of unit productions.
 - Introduce new intermediate non-terminals into the grammar that distribute rules with length > 2 over several rules.
 - So... $S \rightarrow A B C$ turns into
 - $S \rightarrow X C$ and
 - $X \rightarrow A B$
- Where X is a symbol that doesn't occur anywhere else in the the grammar.

Sample L1 Grammar

Grammar	Lexicon
$S \rightarrow NP VP$	$Det \rightarrow that this a$
$S \rightarrow Aux NP VP$	$Noun \rightarrow book flight meal money$
$S \rightarrow VP$	$Verb \rightarrow book include prefer$
$NP \rightarrow Pronoun$	$Pronoun \rightarrow I she me$
$NP \rightarrow Proper-Noun$	$Proper-Noun \rightarrow Houston NWA$
$NP \rightarrow Det Nominal$	$Aux \rightarrow does$
$Nominal \rightarrow Noun$	$Preposition \rightarrow from to on near through$
$Nominal \rightarrow Nominal Noun$	
$Nominal \rightarrow Nominal PP$	
$VP \rightarrow Verb$	
$VP \rightarrow Verb NP$	
$VP \rightarrow Verb NP PP$	
$VP \rightarrow Verb PP$	
$VP \rightarrow VP PP$	
$PP \rightarrow Preposition NP$	

CNF Conversion

\mathcal{L}_1 Grammar	\mathcal{L}_1 in CNF
$S \rightarrow NP VP$	$S \rightarrow NP VP$
$S \rightarrow Aux NP VP$	$S \rightarrow XI VP$
	$XI \rightarrow Aux NP$
$S \rightarrow VP$	$S \rightarrow book \mid include \mid prefer$
	$S \rightarrow Verb NP$
	$S \rightarrow X2 PP$
	$S \rightarrow Verb PP$
	$S \rightarrow VP PP$
$NP \rightarrow Pronoun$	$NP \rightarrow I \mid she \mid me$
$NP \rightarrow Proper-Noun$	$NP \rightarrow TWA \mid Houston$
$NP \rightarrow Det Nominal$	$NP \rightarrow Det Nominal$
$Nominal \rightarrow Noun$	$Nominal \rightarrow book \mid flight \mid meal \mid money$
$Nominal \rightarrow Nominal Noun$	$Nominal \rightarrow Nominal Noun$
$Nominal \rightarrow Nominal PP$	$Nominal \rightarrow Nominal PP$
$VP \rightarrow Verb$	$VP \rightarrow book \mid include \mid prefer$
$VP \rightarrow Verb NP$	$VP \rightarrow Verb NP$
$VP \rightarrow Verb NP PP$	$VP \rightarrow X2 PP$
	$X2 \rightarrow Verb NP$
$VP \rightarrow Verb PP$	$VP \rightarrow Verb PP$
$VP \rightarrow VP PP$	$VP \rightarrow VP PP$
$PP \rightarrow Preposition NP$	$PP \rightarrow Preposition NP$

9/2/08

Speech and Language Processing - Jurafsky and Martin

31

CKY

- So let's build a table so that an **A** spanning from i to j in the input is placed in cell $[i, j]$ in the table.
- So a non-terminal spanning an entire string will sit in cell $[0, n]$
 - Hopefully an S
- If we build the table bottom-up, we'll know that the parts of the **A** must go from i to k and from k to j , for some k .

9/2/08

Speech and Language Processing - Jurafsky and Martin

32

CKY

- Meaning that for a rule like $A \rightarrow B C$ we should look for a B in $[i,k]$ and a C in $[k,j]$.
- In other words, if we think there might be an A spanning i,j in the input... AND $A \rightarrow B C$ is a rule in the grammar THEN
- There must be a B in $[i,k]$ and a C in $[k,j]$ for some $i < k < j$

9/2/08

Speech and Language Processing - Jurafsky and Martin

33

CKY

- So to fill the table loop over the cell $[i,j]$ values in some systematic way
 - What constraint should we put on that systematic search?
 - For each cell, loop over the appropriate k values to search for things to add.

9/2/08

Speech and Language Processing - Jurafsky and Martin

34

CKY Algorithm

```
function CKY-PARSE(words, grammar) returns table  
  
  for  $j \leftarrow$  from 1 to LENGTH(words) do  
     $table[j-1, j] \leftarrow \{A \mid A \rightarrow words[j] \in grammar\}$   
    for  $i \leftarrow$  from  $j-2$  downto 0 do  
      for  $k \leftarrow i+1$  to  $j-1$  do  
         $table[i, j] \leftarrow table[i, j] \cup$   
           $\{A \mid A \rightarrow BC \in grammar,$   
             $B \in table[i, k],$   
             $C \in table[k, j]\}$ 
```

9/2/08

Speech and Language Processing - Jurafsky and Martin

35

CKY Parsing

- Is that really a parser?

9/2/08

Speech and Language Processing - Jurafsky and Martin

36

Note

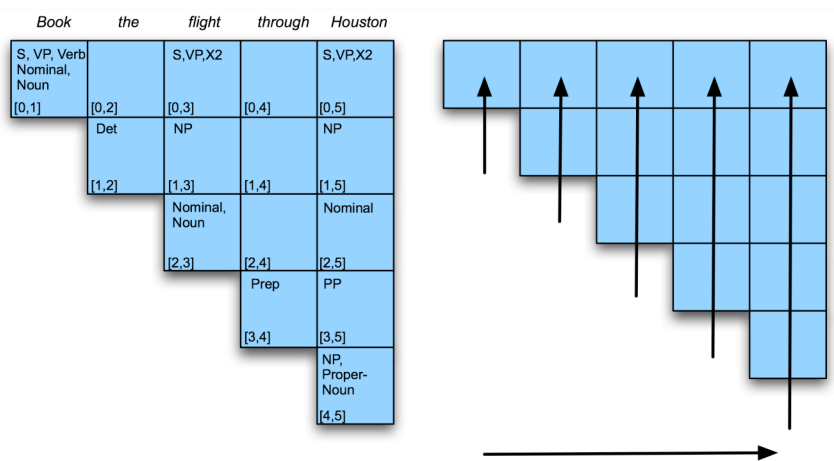

- We arranged the loops to fill the table a column at a time, from left to right, bottom to top.
- This assures us that whenever we're filling a cell, the parts needed to fill it are already in the table (to the left and below)
- It's somewhat natural in that it processes the input a left to right a word at a time
 - Known as online

9/2/08

Speech and Language Processing - Jurafsky and Martin

37

Example

9/2/08

Speech and Language Processing - Jurafsky and Martin

38

Example

<i>Book</i>	<i>the</i>	<i>flight</i>	<i>through</i>	<i>Houston</i>
S, VP, Verb, Nominal, Noun [0,1]	[0,2]	S,VP,X2 [0,3]	[0,4]	[0,5]
	Det [1,2]	NP [1,3]	[1,4]	[1,5]
		Nominal, Noun [2,3]	[2,4]	Nominal [2,5]
			Prep [3,4]	[3,5]
				NP, Proper- Noun [4,5]

Filling column 5

Example

<i>Book</i>	<i>the</i>	<i>flight</i>	<i>through</i>	<i>Houston</i>
S, VP, Verb, Nominal, Noun [0,1]	[0,2]	S,VP,X2 [0,3]	[0,4]	[0,5]
	Det [1,2]	NP [1,3]	[1,4]	NP [1,5]
		Nominal, Noun [2,3]	[2,4]	[2,5]
			Prep [3,4]	PP [3,5]
				NP, Proper- Noun [4,5]

Example

<i>Book</i>	<i>the</i>	<i>flight</i>	<i>through</i>	<i>Houston</i>
S, VP, Verb, Nominal, Noun [0,1]		S,VP,X2		
	Det [1,2]	NP [1,3]		NP [1,5]
		Nominal, Noun [2,3]		Nominal [2,5]
			Prep [3,4]	PP [3,5]
				NP, Proper- Noun [4,5]

9/2/08

Speech and Language Processing - Jurafsky and Martin

41

Example

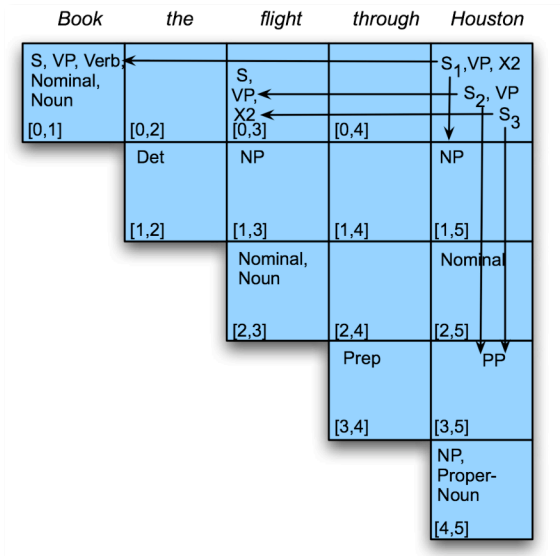

<i>Book</i>	<i>the</i>	<i>flight</i>	<i>through</i>	<i>Houston</i>
S, VP, Verb, Nominal, Noun [0,1]		S,VP,X2		
	Det [1,2]	NP [1,3]		NP [1,5]
		Nominal, Noun [2,3]		Nominal [2,5]
			Prep [3,4]	PP [3,5]
				NP, Proper- Noun [4,5]

9/2/08

Speech and Language Processing - Jurafsky and Martin

42

Example

9/2/08

Speech and Language Processing - Jurafsky and Martin

43

CKY Notes

- Since it's bottom up, CKY populates the table with a lot of phantom constituents.
 - Segments that by themselves are constituents but cannot really occur in the context in which they are being suggested.
 - To avoid this we can switch to a top-down control strategy
 - Or we can add some kind of filtering that blocks constituents where they can not happen in a final analysis.

9/2/08

Speech and Language Processing - Jurafsky and Martin

44

Earley Parsing

- Allows arbitrary CFGs
- Top-down control
- Fills a table in a single sweep over the input
 - Table is length $N+1$; N is number of words
 - Table entries represent
 - Completed constituents and their locations
 - In-progress constituents
 - Predicted constituents

9/2/08

Speech and Language Processing - Jurafsky and Martin

45

States

- The table-entries are called states and are represented with **dotted-rules**.

$S \rightarrow \cdot VP$

A VP is predicted

$NP \rightarrow Det \cdot Nominal$

An NP is in progress

$VP \rightarrow V NP \cdot$

A VP has been found

9/2/08

Speech and Language Processing - Jurafsky and Martin

46

States/Locations

- $S \rightarrow \bullet VP [0,0]$
 - A VP is predicted at the start of the sentence
- $NP \rightarrow Det \bullet Nominal [1,2]$
 - An NP is in progress; the Det goes from 1 to 2
- $VP \rightarrow V NP \bullet [0,3]$
 - A VP has been found starting at 0 and ending at 3

9/2/08

Speech and Language Processing - Jurafsky and Martin

47

Earley

- As with most dynamic programming approaches, the answer is found by looking in the table in the right place.
- In this case, there should be an S state in the final column that spans from 0 to N and is complete. That is,
 - $S \rightarrow \alpha \bullet [0,N]$
- If that's the case you're done.

9/2/08

Speech and Language Processing - Jurafsky and Martin

48

Earley

- So sweep through the table from 0 to N...
 - New predicted states are created by starting top-down from S
 - New incomplete states are created by advancing existing states as new constituents are discovered
 - New complete states are created in the same way.

9/2/08

Speech and Language Processing - Jurafsky and Martin

49

Earley

- More specifically...
 1. *Predict* all the states you can upfront
 2. Read a word
 1. Extend states based on matches
 2. Generate new predictions
 3. Go to step 2
 3. When you're out of words, look at the chart to see if you have a winner

9/2/08

Speech and Language Processing - Jurafsky and Martin

50

Core Earley Code

```
function EARLEY-PARSE(words, grammar) returns chart
  ENQUEUE( $(\gamma \rightarrow \bullet S, [0, 0])$ , chart[0])
  for  $i \leftarrow$  from 0 to LENGTH(words) do
    for each state in chart[i] do
      if INCOMPLETE?(state) and
        NEXT-CAT(state) is not a part of speech then
        PREDICTOR(state)
      elseif INCOMPLETE?(state) and
        NEXT-CAT(state) is a part of speech then
        SCANNER(state)
      else
        COMPLETER(state)
    end
  end
  return(chart)
```

9/2/08

Speech and Language Processing - Jurafsky and Martin

51

Earley Code

```
procedure PREDICTOR( $(A \rightarrow \alpha \bullet B \beta, [i, j])$ )
  for each  $(B \rightarrow \gamma)$  in GRAMMAR-RULES-FOR(B, grammar) do
    ENQUEUE( $(B \rightarrow \bullet \gamma, [j, j])$ , chart[j])
  end

procedure SCANNER( $(A \rightarrow \alpha \bullet B \beta, [i, j])$ )
  if  $B \subset$  PARTS-OF-SPEECH(word[j]) then
    ENQUEUE( $(B \rightarrow \text{word}[j], [j, j + 1])$ , chart[j+1])

procedure COMPLETER( $(B \rightarrow \gamma \bullet, [j, k])$ )
  for each  $(A \rightarrow \alpha \bullet B \beta, [i, j])$  in chart[j] do
    ENQUEUE( $(A \rightarrow \alpha B \bullet \beta, [i, k])$ , chart[k])
  end
```

9/2/08

Speech and Language Processing - Jurafsky and Martin

52

Example

- Book that flight
- We should find... an S from 0 to 3 that is a completed state...

Chart[0]

S0	$\gamma \rightarrow \bullet S$	[0,0]	Dummy start state
S1	$S \rightarrow \bullet NP VP$	[0,0]	Predictor
S2	$S \rightarrow \bullet Aux NP VP$	[0,0]	Predictor
S3	$S \rightarrow \bullet VP$	[0,0]	Predictor
S4	$NP \rightarrow \bullet Pronoun$	[0,0]	Predictor
S5	$NP \rightarrow \bullet Proper-Noun$	[0,0]	Predictor
S6	$NP \rightarrow \bullet Det Nominal$	[0,0]	Predictor
S7	$VP \rightarrow \bullet Verb$	[0,0]	Predictor
S8	$VP \rightarrow \bullet Verb NP$	[0,0]	Predictor
S9	$VP \rightarrow \bullet Verb NP PP$	[0,0]	Predictor
S10	$VP \rightarrow \bullet Verb PP$	[0,0]	Predictor
S11	$VP \rightarrow \bullet VP PP$	[0,0]	Predictor

Note that given a grammar, these entries are the same for all inputs; they can be pre-loaded.

Chart[1]

S12	<i>Verb</i> → <i>book</i> •	[0,1]	Scanner

9/2/08

Speech and Language Processing - Jurafsky and Martin

56

Efficiency

- For such a simple example, there seems to be a lot of useless stuff in there.
- Why?
 - It's predicting things that aren't consistent with the input
 - That's the flipside to the CKY problem.

9/2/08

Speech and Language Processing - Jurafsky and Martin

57

Details

- As with CKY that isn't a parser until we add the backpointers so that each state knows where it came from.

9/2/08

Speech and Language Processing - Jurafsky and Martin

58

Back to Ambiguity

- Did we solve it?

Ambiguity

- No...
 - Both CKY and Earley will result in multiple **S** structures for the **[0,N]** table entry.
 - They both efficiently store the sub-parts that are shared between multiple parses.
 - And they obviously avoid re-deriving those sub-parts.
 - But neither can tell us which one is right.

Ambiguity

- In most cases, humans don't notice incidental ambiguity (lexical or syntactic). It is resolved on the fly and never noticed.
- We'll try to model that with probabilities.
- But note something odd and important about the Groucho Marx example...
